Outline

Two words about interfacial physics

2 True contact area

How does it grow with the squeezing force?

3 Interfacial fluid flow

How does the permeability decay with the squeezing force?

4 Conclusions & perspectives

How physical are the assumptions and results?

Objective:

link **roughness** parameters with the evolution of the true **contact area** and interface **permeability** with external pressure.

Contact between rough surfaces

Problem statement & methods

Problem

- Solve contact problem for two elastic half-spaces E_1 , v_1 and E_2 , v_2
- With surface roughnesses $z_1(x, y)$ and $z_2(x, y)$
- Balance of momentum $\nabla \cdot \underline{\sigma} = 0$,
- Boundary conditions $-\sigma_z^{\infty} = p_0$
- Contact constraints $g \ge 0$, $p \ge 0$, g p = 0, where g(x, y) is the gap between surfaces, $p = -\underline{n} \cdot \underline{\sigma} \cdot \underline{n}$ is the contact pressure.

Methods

[1] Yastrebov, Wiley/ISTE (2013)

Boundary element method

Mapping

- Flat elastic^[1] half-space with $E^* = \frac{E_1 E_2}{E_2 (1 v_1^2) + E_1 (1 v_2^2)}$
- **Rough** rigid^[1] surface with $z^* = z_2 z_1$
- Optimization problem^[2]: min *F*

under constraints $p \ge 0$ and $\frac{1}{A_0} \int p dA = p_0$,

with
$$\mathcal{F} = \int_{A} p[u_z/2 + g] dA$$

Comparison of models

Asperity based models

Persson's model

1. Evolution of the real contact area $A(p_0)$ for $A/A_0 \rightarrow 0$

 $\kappa_{BGT} = \sqrt{2\pi} \approx 2.5$ according to [2-5]

 $\kappa_{\rm P} = \sqrt{8/\pi} \approx 1.6$ according to [6-7]

2. Evolution of the real contact area $A(p_0)$ for $\forall A/A_0$

 $\frac{A}{A_0} = A(p_0, \alpha)/A_0$ according to [2-5]

$$\frac{A}{A_0} = \operatorname{erf}\left(\sqrt{\frac{2}{\langle |\nabla z|^2 \rangle}} \frac{p_0}{E^*}\right) according \text{ to [6-7]}$$

Simulations set-up

- Cut-off parameters: $L/\lambda_l \otimes L/\lambda_s = \{1, 2, 4, 8, 16\} \otimes \{32, 64, 128, 256, 512\}$
- Hurst exponent $H = \{0.4, 0.8\}$
- 10 random surface realizations per combination of parameters
- Discretization: $\{L/\Delta x\} \times \{L/\Delta x\} = 2048 \times 2048$
- Search for contact area A', gap field g(x, y) and gap PDF P(g)

Results: contact area

[1] Bush, Gibson, Thomas, Wear 35 (1975), [2] Carbone, Bottiglione. J. Mech. Phys. Solids (2008), [3] Persson. J. Chem. Phys. (2001)

Real contact area: interpretation of results?

Raw data

[1] Yastrebov, Anciaux, Molinari, Int J Solids Struct 52 (2015)

Contact area is overestimated in simulations:

 $A_{\rm sim} > A_*$

Contact area is overestimated in simulations:

 $A_{\rm sim} > A_*$

The overestimation is localized at boundary nodes:

 $A_{\rm sim} > A_* > A_{\rm sim}^{\rm int}$

Contact area is overestimated in simulations:

 $A_{\rm sim} > A_*$

The overestimation is localized at boundary nodes:

 $A_{\rm sim} > A_* > A_{\rm sim}^{\rm int}$

■ Boundary area ~ perimeter *S*_d:

 $A_{\rm sim} - A_{\rm sim}^{\rm int} = S_d \Delta x$

Contact area is overestimated in simulations:

 $A_{\rm sim} > A_*$

The overestimation is localized at boundary nodes:

 $A_{\rm sim} > A_* > A_{\rm sim}^{\rm int}$

■ Boundary area ~ perimeter *S*_d:

 $A_{\rm sim} - A_{\rm sim}^{\rm int} = S_d \Delta x$

■ Manhattan *S*_d vs Euclidean metric *S*:

 $\langle S \rangle = \frac{\pi}{4} \langle S_d \rangle$

Contact area is overestimated in simulations:

 $A_{\rm sim} > A_*$

The overestimation is localized at boundary nodes:

 $A_{\rm sim} > A_* > A_{\rm sim}^{\rm int}$

■ Boundary area ~ perimeter *S*_d:

 $A_{\rm sim} - A_{\rm sim}^{\rm int} = S_d \Delta x$

■ Manhattan *S*_d vs Euclidean metric *S*:

 $\langle S \rangle = \frac{\pi}{4} \langle S_d \rangle$

True contact area estimation:

$$A_* \approx A_{\rm sim} - \frac{\beta}{4} \frac{\pi}{4} S_d \Delta x$$

Simplified elliptic model: [2] Greenwood, Wear (2006)

Phenomenological relationship

• Contact area *A* grows with applied pressure p_0 as

$$\frac{A}{A_0} = a(\alpha) \frac{p_0}{E^* \sqrt{2m_2}} - b(\alpha) \left[\frac{p_0}{E^* \sqrt{2m_2}} \right]^2$$

■ Contact area fraction *A*′ = *A*/*A*₀ grows with normalized applied pressure *p*′ = *p*₀/*E*^{*} √2*m*₂

$$A' = a(\alpha)p' - b(\alpha)p'^2$$

■ With ≈universal adimensional constants:

 $a(\alpha) = 2.35 - 0.057 \ln(\alpha - 1.5)$

 $b(\alpha) = 2.85 - 0.24 \ln(\alpha - 1.5)$

Pressure dependent friction coefficient:

$$\mu(p') = \mu_0 \left[1 - \frac{b(\alpha)}{a(\alpha)} p' \right]$$

with $\mu_0 = a(\alpha) \tau_{\max} / E^* \sqrt{2m_2}$,

 $\tau_{\rm max}$ is the maximum shear traction the contact interface can bear.

- Contact area growth almost linearly for small pressures and saturates at bigger pressure
- The key parameter of the contact area growth is the RMS slope or its variance $2m_2$
- Contact area depends weakly on Nayak parameter $\alpha = m_0 m_4 / m_2^2$

 $A' = a(\alpha)p' - b(\alpha)p'^2$

with $a(\alpha) = 2.35 - 0.057 \ln(\alpha - 1.5)$, $b(\alpha) = 2.85 - 0.24 \ln(\alpha - 1.5)$

■ No effect of fractal dimension *D_f* per se on the contact area *it affects the contact area only through the Nayak parameter*

Flow through the contact interface

Problem statement

Problem

- Thin creeping flow in contact interface: Navier-Stokes → Stokes → Reynolds equation
- In addition: incompressible fluid, immobile walls:

$$\nabla \cdot \underline{q} = 0, \quad \underline{q} = -\frac{g^3}{12\mu} \nabla p_f$$

 $\underline{q}(x, y)$ is the fluid flux, $\overline{g}(x, y)$ is the gap (opening) fields, $p_f(x, y)$ hydrostatic fluid pressure, μ is the dynamic viscosity.

- Gap profile g(x, y) for $x, y \in (0, L)$
- At inlet: $p_f = p_{in}$
- At outlet: $p_f = p_{out}$
- At lateral sides: periodic $q_n(y = L) = -q_n(y = 0)$
- Linear problem: use FEM

Analytical approach

Effective flow estimation

• Averaging over surface $\langle x \rangle = 1/A_0 \int_{A_0} x \, dA$ gives:

$$\langle \underline{q} \rangle = -\underline{\underline{K}}_{eff} \cdot \langle \nabla p_f \rangle$$

• For isotropic case, normalized scalar **effective transmissivity** along pressure drop *OX*:

$$K'_{\text{eff}} = -\frac{12\mu\langle q_x \rangle L}{m_0^{3/2}(p_{\text{in}} - p_{\text{out}})}$$

■ Using effective medium^[1,2] approach

$$(1 - A') \int_{0}^{\infty} \frac{g^{3} P(g)}{g^{3} + K'_{\text{eff}} m_{0}^{3/2}} \, dg = \frac{1}{2}$$

 $A' = A/A_0$ is the contact area fraction, P(g) is the gap probability density.

Effective contact area

Effective contact area

Normalized effective transmissivity

Effective transmissivity

Effective area wrt load:

 $A_{\rm eff}'\approx 2.15p'$

Normalized load:

 $p'=p_0/E^*\sqrt{2m_2}$

 Normalized effective transmissivity wrt effective area:

 $K'_{\rm eff} \approx 500 \exp(-28A'_{\rm eff})$

Effective transmissivity

Effective area wrt load:

 $A_{\rm eff}'\approx 2.15p'$

Normalized load:

 $p'=p_0/E^*\sqrt{2m_2}$

Normalized effective transmissivity wrt effective area:

 $K'_{\rm eff} \approx 500 \exp(-28 A'_{\rm eff})$

Recall:

$$K'_{\rm eff} = -\frac{12\mu\langle q_x \rangle L}{m_0^{3/2} \Delta P_f}$$

Express the mean flow:

$$\langle q_x \rangle = -\frac{K'_{\text{eff}} m_0^{3/2} \Delta P_f}{12 \mu L}$$

Finally:

$$\langle \, q_x \, \rangle \approx - \frac{41.7 \exp(-42.57 p_0/E^* \, \sqrt{m_2}) m_0^{3/2} \Delta P_f}{\mu L} \label{eq:qx}$$

Conclusion & current work

Main result:

Mean flow¹ through contact of nominal area $L \times L$:

$$\langle q_x \rangle \approx -\frac{41.7m_0^{3/2}\Delta P_f}{\mu L} \cdot \exp\left(-42.57\frac{p_0}{E^*\sqrt{m_2}}\right)$$

 μ is dynamic viscosity,

 ΔP_f is the pressure drop between the inlet and the outlet,

 p_0 is the nominal applied pressure,

 E^* is the effective elastic modulus.

Roughness parameters:

 m_0 is the variance of roughness,

 $2m_2$ is the variance of roughness gradient.
